Rack & Roll.

Rackmounting an off-the-shelf desktop Hewlett-Packard 9000 Model 712 preserves the workstation's warranty, service and price.

An optional removable drive subsystem lets you add 6 additional 3.5" devices, including up to 25GB of hot plug disk.

With virtually the same footprint as the HP 712 workstation, Sphinx adds two additional devices as a stand alone chassis or mates with the removable drive subsystem for high capacity requirements.

Now Available For Hewlett-Packard.

Artecon's **Sphinx**™ now gives you rackmount capability for your off-the-shelf desktop Hewlett-Packard 9000 Model 712 workstation or server. The optional hot plug removable drive subsystem lets you add all the devices you need to build a powerful server - for thousands of dollars less than a preconfigured package. And you can have all this in only 5.25" (3u EIA) of vertical rack space.

For The First Time Ever.

The **Sphinx** neatly encapsulates your HP workstation and fits any 19" EIA rack. Its innovative design features side mounted slides, whisper quiet forced air fans, patented tuck-away lug handles, and up to two additional 3.5" or half height 5.25" devices. In the rear you'll find completely unobstructed access to the workstation backplane, as well as access to internal peripheral devices such as the Model 712's floppy disk drive.

Sphinx' modularity offers you a wide variety of configurations.

Modular, Expandable, Reliable.

The optional removable drive subsystem supports as many as six additional 3.5" disk or tape devices, including up to 25GB of hot plug, high performance, removable disks on one or two SCSI busses. Power, keyboard, and RS-232 for the workstation feed through to the front of the enclosure, supporting easy access to power on/off, terminal or modem devices, and rack-mounted keyboards.

Off-The-Shelf.

Artecon's rackmounted solutions make the most of your Hewlett-Packard workstation by expanding its use beyond the desktop. You've never seen this much potential in such a small footprint, nor so many ways to configure I/O devices. With a **Sphinx** enclosure, your existing HP workstation retains the manufacturer's warranty, service, upgradeability and price, because it never leaves the original case.

So call Artecon today and get ready to RACK & ROLL!

Introducing NETWORK PRINTING VIA NLM

NP92

MiniSoft introduces the most efficient software solution on the market for directing HP3000 spoolfiles to network printers. NP92 may be implemented as an NLM to append spoolfiles to Novell print queues, or operate as a background task on the HP3000 and transparently spool output to network print destinations.

- Spoolfiles and reports printed directly on TCP/IP linked printers.
- Supports all major LAN cards.
- Supports Novell, LAN Manager, Banyan and Unix.
- Bi-directional printing.
- Prices start at \$995.

The Lava Man Cometh

As usual, I find myself alone on deadline night, basking in the warm gray glow of my 19-inch X terminal that doubles as a picture frame, wondering what to write about. And as usual, HP didn't disappoint me. At the eleventh hour, HP provided the fodder for this month's editorial. No, it's not a new server and not a corporate merger; it's not a new RISC technology and Glenn Osaka hasn't been promoted again. No, it's just a goofy picture of a guy playing hopscotch over a lava flow.

And guaranteed, HP won't disappoint you with this, their latest global advertising campaign aimed at the executive-level reader. The campaign is the work of Saatchi & Saatchi Advertising and it's sure to catch the eye of even the most casual of readers.

Many of you probably saw the first of these ads in *Business Week* or *USA Today*, when Lava Man leapt off the page. This type of funky campaign may be one small step for a company like Nike, but it is without a doubt one giant leap for HP.

I was privy to review a sampling of the ad series last month. The print ads are focused around a black and white "Mr. Businessman," exemplifying a typical HP executive customer overcoming colorful "business obstacles," such as hurdling a river of lava, shooting a pipeline wave, pole vaulting over an Arctic Sea of ice and one Monty Python-esque shot of a guy climbing a human face. I honestly can't remember the last time I yelled "Look out George! There's a lava flow coming down the hall!"

OK, I get it. It's art. Or as Mary Allard, HP's worldwide marcom manager for the computer systems organizations explains, "It's a conceptual view of the reality CEOs and CIOs face everyday." And I buy that. No question, these ads are powerful. And they are funny. Although, I must admit my first reaction was that maybe a few of those wacky weed plants were still laying around HP's ball fields.

Then I thought of the old adage: "Be careful what you ask for; you just might get it." For years we've been beating the "Cold Dead Fish" analogy when discussing HP's marketing savvy. So now HP counters with Lava Man.

Hep, hip, '90s, eclectically trendy or obtuse; call it what you will — it's definitely not HP. And, it's definitely about time. I applaud HP for once again going their own way. Whether it's PA-RISC technology or a unique ad campaign, HP follows no one.

While their competitors blast the TV airwaves with grungy Generation X slackers "cool duding" and "awesomeing" IBM's OS/2 Warp, HP targets the audience who spends the big bucks.

Make no mistake about it. This isn't an image-boosting campaign like IBM and DEC are in the midst of. With reported revenue growths like 45 percent for the HP 9000 and 50 percent for software products such as OpenView and SoftBench, HP's image is solid.

HP's undeniable reputation for quality lives and breeds among its user base and other techno weenies. However, it's the head honcho CEOs and CIOs, who ultimately sign those seven-figure expense reports, that HP hopes to reach with this three- to five-year ad campaign.

HP, which credits about half of its business to international customers, previously tailored ads individually to specific countries. With the new campaign they hope to achieve a consistent image that will increase its presence in the world market. According to Allard, the challenge for HP was to come up with a universal message to introduce the brandname. "Many executives still think printers when they hear HP. This campaign will make them think computers."

So kudos to HP, and those who had the vision and the guts to leap into the lava. You have a fan.

"I SHOULD HAVE USED QUICK RESTORE V2 INSTEAD OF UNIX UTILITIES."

System administrator pondering his future.

With Quick Restore V2, you can do lots of things that UNIX utilities simply can't do.

- Like lightning-fast restores and totally automatic backups. ● Quick Restore V2

**MONEYBACK
GUARANTEE!**

controls data backup and recovery from any point in the network—without using NFS. ● Its on-line indexing, automatic volume location and direct-to-block positioning help you locate and restore your data fast. ● Our ISO-compliant recording format

allows users to recover backed up data without Quick Restore V2 installed.

- And Quick Restore V2's GUI and command-line interfaces give you the power and flexibility to manage your network both on-site and remotely. ● Quick Restore V2 runs natively on all of today's popular workstation platforms and is compatible with today's leading tape formats. ● Best of all, Quick Restore V2 is simple to learn and easy to use. No needless bells. No useless whistles. ● Just solid, reliable backup and recovery software that will help you optimize the performance of your network. ● To evaluate how Quick Restore V2 can make a difference for you, give us a call at 1-800-487-0080 ext.266.

LETTERS TO THE EDITOR

A Work In Progress

It was with great interest that I read the November 1994 issue.

The quote that most struck me in the Networking column "X On The HP 9000 Series 800" was the following: "If you are running your applications across other platforms that do not support HP VUE, then you may want to stay with generic X."

We [HP] have been working hard to solve the cross-platform issues through the Common Desktop Environment. The four leading UNIX vendors: HP, IBM, Novell and Sun have banded together to provide a common desktop environment. The services and APIs will be available on all of these platforms. They have even been submitted to X/Open for standardization, which will most likely be concluding this month.

*Axel Deininger
Engineer/Scientist
Workstation Technology Division
Hewlett-Packard*

UNIX USEFULNESS

Just a note to let you know I enjoyed Fred Mallett's column in the December 1994 issue. Keep up the good work — there's a lot of new guys like me that need the help.

*Edd Carter
Systems Programmer Analyst
Enterprise Server Resources
Florida Power Corp.*

We at *HP Professional* understand and accept the challenge of the global market. So next month, we launch the premier issue of *HP Professional Asia Pacific*.

Through an agreement with Hewlett-Packard Asia Pacific, the bi-monthly, *HP Professional Asia Pacific* will reach over 9,400 users of HP computing systems in Australia, Hong Kong, Japan, Korea, Malaysia, the Peoples Republic of China, Singapore, Thailand and Taiwan. *HP Professional Asia Pacific* provides coverage and analysis on the use and integration of the HP 9000, workstations, PCs, LANs and WANs, as well as the HP 3000 in multivendor environments.

HP Professional welcomes comments from its readers. Letters may be edited for brevity and clarity, and should be addressed to: HP Professional, 1300 Virginia Dr., Ste. 400, Fort Washington, PA 19034. Fax number: (215) 643-4827. Internet address for staff listed on the masthead:

INDUSTRY WATCH

George A. Thompson

10-DING TO THE ENTERPRISE

HP wants you to know, there is no need to be tense about HP-UX 10.0, its aspiring enterprise OS. Announced earlier this month, HP's new UNIX OS upgrade is being released in two stages. First, a production quality version called the **New Business Release** will be available in the next few weeks.

According to David Scott, software product line manager, the New Business Release is primarily for three groups: HP ISVs who are waiting for final recertification of their applications; HP installed base customers with new project opportunities; and HP customers with dedi-

cated test or development systems. The New Business Release will support: HP 9000 Series 800 servers (Models E, F, G, H, I, 8x7/890/T) and Series 700 workstations (Models 712/715/720/725/735/755).

Fifty key ISVs — Oracle, Sybase and Informix among them — have been given early access to help them recertify their databases as soon as possible after the General Business Release. The remaining ISVs will have access shortly thereafter. So, according to Scott, customers who can afford to test and implement new systems can get to work early.

A **General Business Release** will be available in mid-1995 intended for

new and current HP-UX 9.x customers. By that time, says Scott, customers will have what they need for a complete solution. All the key ISV apps will have been recertified; all the layered HP applications will be available (only half will be ready in the New Business Release); and also available are the automated update tools that will help "push" the new OS into the installed base. The remaining HP 9000 hardware also will be supported at that time.

HP's different approach with HP-UX 10.0 came after massive customer feedback. "After we introduced HP-UX 9.0, customers complained that the OS couldn't work with all their apps. They didn't have what they needed for a complete solution. Our customers told us to do it this way," says Scott. ●

INTEL'S REPENTUM

By now, everyone must realize that Intel has given new meaning to the expression — united we stand, divided we fall. After admitting that they knew about a dividing error in the floating point unit of their bread-and-butter Pentium CPU and enduring jokes like "Intel Inside, but can it divide?" the company was forced into a carte blanche replacement policy for the miscalculating chips. Despite their consumer-like "Intel Inside" branding strategy, Intel showed that they are still engineers at heart when they sought to replace only Pentiums CPUs involved in scientific or engineering applications.

According to a post by Intel CEO Andy Grove on the comp.sys.intel newsgroup, "an error is only likely to occur at a frequency on the order of once in nine billion random floating point divides." Apparently, most scientists and engineers, as well as average consumers, (in an unusual

display of unity) didn't like those odds. Beaten by the bad publicity, Intel has since reconsidered its initial response and is replacing all its Pentium CPUs in previously sold systems for those that request it.

HP's PC division is supporting Intel's policies. But NetServer customers, are advised to contact HP through the usual technical support channels for assistance. HP desktop owners can work through Intel or HP.

ERRATA INSIDE A HOUSE DIVIDED

Adding insult to injury, in January by a 4-3 decision, the California Supreme Court upheld a former ruling of arbitrators who decided that Advanced Micro Devices (AMD) had the right to use Intel's 386 technology without paying royalties. This is a long-standing argument between Intel and AMD that goes back as far as 1982, before Intel achieved its now near-monopolistic stature.

At that time, the company wanted and needed to second-source its 286 CPU technology to others, like AMD, to "seed" the market. AMD claimed that the same agreement also gave them the rights to the 386 CPU as well. Not so, claimed Intel, especially after it saw the potential of having a virtual lock on the market. Intel reneged. But now four years of arbitration and millions of dollars in legal expenses later, the Court finally decided that Intel acted in bad faith. ●

I SAW A FILM TODAY, OH BOY

HP's Video Communications Division has struck again. Formed in 1992, HP's newest division will provide its newly-named MediaStream Server to Singapore Telecom for an 18-month video-on-demand trial. In the past year, Pacific Telesis, BellSouth and Southern New England Telephone of Connecticut also have contracted HP for the MediaStream Servers. "We're very happy about our increasing momentum," says Greg Hoberg, manager of broadband solutions.

The Singapore government-sponsored "IT 2000" program is expected to reach 300 homes but is planned to eventually reach all 3.2 million residents of Singapore. The Interactive television service will offer a mix of customized news, home shopping and movies, among other interactive features, like interactive learn-

ing for children and adults. "We think [Singapore] is a country that can move very quickly in the interactive TV market — they have invested in fibre and their phone system is already advanced," says Hoberg. HP also is working with Fujitsu on ATM technology, with Phillips on set-top box controllers and with Sybase on the software side.

Unlike other computer systems that are configured to handle video, HP's MediaStream Server is designed specifically for the task of delivering video.

NOTABLE QUOTABLES

"At Intel, Quality is Job 0.9999998!"

— The Wisdom of the Net

"You can solve the video serving problem [with existing computers], but you pay a lot for the CPU to get the I/O you need," explains Hoberg. The reason is the MediaStream's video transfer engine. "It's very efficient at taking video streams off a disk and getting it into the network, while another component handles the control issues," explains Hoberg. The MediaStream server is scalable and able to deliver from 75 to 10,000 streams of video.

But the Video Communications Division is not the only part of HP to get into the interactive act. This past December, HP participated in Time-Warner's test of its well-publicized, but often delayed, interactive TV service called the Full Service Network (FSN). HP provided 3,500 full-color inkjet printers (HP DeskJet 550C and 1200C) to Orlando, Fla. homes that are participating in the project. FSN subscribers will then be able to send print files to the HP printers via SGI-designed

RESEARCH ROUND-UP

■ HP's OfficeJet will jumpstart the multifunction market, according to BIS strategic Decisions (Norwell, Mass.) helping to crack open a \$3.5 billion market by 1998. The HP OfficeJet provides printing, faxing and scanning functions in a single machine. The market for personal multifunction devices will be driven by growth in the small office/home office (SOHO) market, which by 1995 will include 43 percent of U.S. households, according to Judith Pirani, director of the multifunction products service at BIS.

■ With the reduced cost of computer equipment and the increase in computer use, small businesses now have access to technology that was once the province of Fortune 500 companies only. Yes, small is suddenly looking beautiful to major hardware and software vendors who once shunned small businesses because they preferred the Big Budgets of Big Business. In fact, according to the Business Research Group (BRG; Newton, Mass.) taken as a whole, the small business market will: spend \$16 billion for information technology in 1994; purchase 1 million new

PCs in 1995; and deploy 2 million new telephone lines, while spending \$1.9 billion each month for local and long distance telephone service

According to BRG's "Buying Plans and Perceptions of the Small Business Decision Maker," there are 4.33 million small businesses (non-agricultural enterprises with one to 99 employees) in the United States employing 37.7 million workers. But selling to that group could prove difficult. That's why BRG identified four psychographic profiles: Mom and Pops, Rotarians, Steady Pacers and Rapid Risers. The first three groups

comprise about two-thirds of the 700 IS small business decision makers surveyed. Rapid Risers, the smallest group, however, had the largest average yearly IS budget at \$14,000, followed by Steady Pacers with \$7,000, Rotarians with \$5,200 and Mom and Pops with \$1,900. The Rapid Risers are the classic, start-up entrepreneurial types containing the largest and youngest companies. "[Rapid Risers] are the most likely to adopt emerging technologies," say Warren Childs, director of primary research. For more information, call BRG at (617) 558-4609.

set-top boxes (HP and SGI worked together to develop the software).

Initially, Chrysler, the Warner Brothers Studio Store and the U.S. Postal Service will offer print capability as part of their interactive advertising on FSN. Chrysler plans to let users print information about car features, styling and design safety as well as listings of local Chrysler dealers. Warner Brothers stores and the Postal Service plan to allow users to print maps of their locations.

HP also is poised to participate in the ordering and fulfilling of interactive requests with an HP 3000-based server running Smith-Gardner's Mail Order and Cataloging System (MACS) which resides at the FSN building in Orlando. "The HP 3000/MACS system will automatically verify an item in inventory, confirm the order, then pick up and ship the product to the customer," says Lee LeFaivre, Smith-Gardner's director of marketing. "HP printers will then provide receipts or confirmations of the order that was placed." The HP 3000/MACS system is one of the fastest growing order fulfillment solutions in the direct-marketing industry and also used by QVC, Home Shopping Network, HanoverDirect, Microwarehouse, Hammacher Schlemmer & Company, Levengers and Paper Direct. ●

SETTING THE PACE

A study by Pacer Software (Westborough, Mass.) found that 33 percent of the companies using their Macintosh connectivity software at DEC sites plan to migrate some their VAX/VMS apps to non-DEC UNIX systems.

About 18 percent of all respondents (66 companies which include corporations and universities) plan to use Sun Microsystems SPARC, 9 percent are planning to use HP 9000s and 8 percent showed an interest in the IBM RS/6000 platform. According to the Pacer, these percentages represent a 355 percent increase in Sun, 40 percent increase in HP and 421 percent in IBM deployment by the end of 1995. ●

Real Printer and Print Queue Management for UNIX!

LP Plus
Puts YOU in Complete Control of your UNIX Print Operations

"LP Plus has filled a vast void UNIX has in dealing with printer spooling needs. Fantastic product!"

Gary Dame, MIS Director-Pacific States CIP

The print command you get with UNIX gives you the "bare bones" of printing, and not a bit more.

LP Plus delivers the control and flexibility needed to manage a dynamic print operation. It's a product designed by people who realize that priorities change, printers break down, and sometimes only one page of a 50-page report needs to be printed.

Whether your system has two serial printers or 200 network printers, LP Plus lets users and administrators manage their print environment.

Call 1 800-274-1627, for a **free evaluation** copy. Use the complete product for 30 days. If you are not satisfied that LP Plus greatly enhances the productivity of your print operation, simply remove LP Plus and give the print operations back to UNIX.

Digital Controls

LP Plus...

- ◆ Delivers only the printing you want, a page at a time, a range of pages, or an entire job
- ◆ Lets you suspend and start printing at any page, or at the last page printed
- ◆ Provides real-time printer and queue status
- ◆ Offers true bi-directional UNIX/Novell printing*
- ◆ Provides complete lpd/lpr compatible printing
- ◆ Lets you decide which spool files to retain, which ones to purge,... and when

*Requires NovPrint™ and Netware's TCP/IP (an NLM included with Netware v3.11 or later).

M.B. Foster Connects With ODBCLink

ODBC LINK

- Direct support for TurboIMAGE, KSAM, MPE, IMAGE/SQL and Allbase on MPE/iX 4.0 and higher
- LAN and serial support
- Server-based licensing with unlimited clients costs \$3,000 to \$15,000

M.B. Foster Associates

50 Water Street
P.O. Box 580
Chesterville, ON K0C 1H0

tel: (800) ANSWERS
fax: (613) 448-2588

CIRCLE 353 ON READER CARD

ODBCLink, from M. B. Foster Associates (Chesterville, Ontario), is an implementation of Microsoft's Open Database Connectivity (ODBC) protocol. With ODBCLink, ODBC-compliant client software, such as Microsoft Access, Visual Basic, Powerbuilder and Cognos' Impromptu, can access TurboIMAGE (IMAGE/SQL) or Allbase/SQL databases, KSAM files and MPE flat files on an HP 3000 host over a LAN or serial connection.

ODBCLink supports four communications methods: serial, modem connect, WRQ's PPL or WinSock driver. It can handle setup and dial scripts for modem connections as well as sign-on strings for serial direct and serial modem connections. ODBCLink has two distinguishing fea-

tures: it implements the ODBC protocol over serial connections; and it enables direct connection to "native" TurboIMAGE databases without having to "attach" the database to a DBE.

All ODBC level-1 functions are supported except cursor naming and SQLPUTDATA in chunks. Also supported are ODBC LONGVARBINARY data types for downloading binary large objects (BLOBs), such as compressed photographs or document images, stored on the HP host as Allbase/SQL LONGVARBINARY items. Field types supported include CHAR, VARCHAR, INTEGER, SMALLINT, LONGVARCHAR, LONGVARBINARY, single and double precision FLOAT and PACKED DECIMAL.

ODBCLink supports the Allbase/SQL and IMAGE/SQL syntax and a subset of SQL for direct TurboIMAGE access. The supported commands for TurboIMAGE include INSERT, DELETE, UPDATE and SELECT with outer-join, complex WHERE clauses, ORDER BY and DISTINCT. Aggregate functions, GROUP BY, calculated fields, subqueries, COMMIT and ROLLBACK are not implemented.

Because roughly 25 percent of all HP 3000 sites already use Cognos' PowerHouse 4GL, the PowerHouse Dictionary (PDL)

is required to access KSAM or MPE files. Access methods include keyed reads off KSAM files, and joins between KSAM files and TurboIMAGE databases.

The DataExpress File Description Generator (DXFDGEN) Tool will be added in a second quarter release. Also planned for the same release is support for Oracle and for the TurboIMAGE Third Party Indexing (TPI) Interface. The TPI provides the interface to the Omnidex and the Superdex indexing products. These tools improve the performance and functionality of TurboIMAGE access.

Originally intended to be a standalone product, M. B. Foster's current strategy calls for ODBCLink to merge in the functionality of Core DataExpress during 1995. The addition of DXFDGEN is the first step in this process. Server-based licensing with unlimited clients costs between \$3,000 and \$15,000.

The ODBCLink server currently runs on any HP 3000 Series 9xx host under MPE/iX 4.0 or higher. Client software is supported under Microsoft Windows 3.1 or Windows for Workgroups 3.11.

A server version for the HP 9000, initially supporting ODBC access to Allbase/SQL and Oracle, is planned for mid-1995.

Emulate The Future With DynaComm

DYNACOMM

- Supports Visual Basic
- Scripting language contains over 350 commands and functions
- Price starts at \$249 for a single user

FutureSoft

12012 Wickchester Lane
Ste. 600
Houston, TX 77079
tel: (713) 496-9400
fax: (713) 496-1090

CIRCLE 354 ON READER CARD

The joy of emulation is the ability to focus on an application without having to worry about the system it is running on. FutureSoft's (Houston, Texas) DynaComm, a communications package for Microsoft Windows, allows users to do just that. DynaComm supports a wide range of binary transfer protocols and most popular emulation programs. It allows users to store and recall communications parameters and provides a programmable toolbar which can store frequently used strings, such as passwords and login sequences.

According to Eric Grayson, vice president and European representative at FutureSoft Europe in The Netherlands, DynaComm's emulation ability is what sets it apart from its competitors.

"DynaComm is sold as one product for all emulations," Grayson says. Emulation support includes: VT-52, VT-100, VT-220, VT-340 and Pathworks 4.x, as well as ADDS VP/60, ANSI Color, AT&T 605/705, CompuServe (Vidtex), Data General Dasher, Generic (TTY), HP 9000 Series 700/94, IBM 3101, Televideo 925/950 and Wyse 50/60 terminals. The international version includes Vidtel, MiniTel and ViewData/Prestel support.

Version 3.2 includes support for Visual Basic (VB). With the DynaComm Toolkit for Visual Basic, programmers are now able to write custom Windows front-ends that can access all of DynaComm 3.2's functionality, such as connectivity, emulation options and file transfer protocols, such as Kermit, XModem (Checksum and CRC), YModem (batch mode), CompuServe B+, YModem/G and YModem-251.

At the heart of the setup program is the file-by-file selective install feature which lets users install the combination connectors, emulators and protocols they need, thus minimizing DynaComm's footprint on servers or PCs. Users also have access to popular TCP/IP utilities such as PING, ftp and SNMP or other external applications (Word or Excel). Users are given the option to install these utilities as an icon on the default toolbar. It

also offers access to other Windows applications via Dynamic Data Exchange (DDE), which can share information between applications.

The enhanced dialog editor lets users, through a powerful scripting language, create custom front-ends for mainframe applications with graphical tools which the dialog editor then interprets, creating the script code necessary to duplicate the design. The scripting language contains over 350 commands and functions and allows automated session with remote systems. It supports real numbers, floating point math, parameter passing, 192 variables and indirect variable referencing. And, it is compiled for fast execution.

Other new features include: improved ANSI emulation; new scripting verbs for passing global variables back to the dialing directory; updated online help; an enhanced Queue dialer; keyboard remapping facilities; a toolbar editor; and an updated user's guide.

U.S. clients include AT&T GIS, Dun & Bradstreet and HP. European clients include the Statistic Ministry of Hungary, the Norwegian Army and the RATP (Paris Metro). Price starts at \$249 for a single user.

Managing The CA Way

Computer Associates International Inc. Enhances UniCenter For Client-Server

"Computer Associates bought [Ingres] to be an underlying technology for its own products."

Alan Paller
Director of Open Systems
Computer Associates
International Inc.

**Computer
Associates
International Inc.**

One Computer Associates

CIRCLE 352 ON READER CARD

Open systems and client-server computing promise real benefits. Unfortunately, a low cost-of-ownership is not usually one of them. With enhancements and pricing adjustments for its UniCenter product line, as well its purchase of the Ingres database (acquired from the ASK Group this past June), Computer Associates (CA; Islandia, N.Y.) hopes to help improve the transition to, and reduce some of the costs of, client-server technology.

"A key criteria for our clients was that UniCenter support multiple, heterogeneous platforms," says Yogesh Gupta, senior vice president for product strategy at CA. In October 1994, CA added the CA-Unicenter/Star cross-platform systems management workstation to its Unicenter offering. Star provides a single point of control for the administration of OS/2, MVS, AS/400, Microsoft Windows NT and NetWare platforms and software architectures. "Star provides a systems administrator with a single desktop and single graphical user interface to manage all of these environments across an entire enterprise," says Gupta.

Two additional products, CA-Unicenter Software Delivery and CA-Unicenter/DB Alert and Systems Alert, help system administrators deal with problems inherent to distributed platforms.

CA-Unicenter Software Delivery automates the distribution of programs and updates across Novell, NT and OS/2 LANs; UNIX, Windows and DOS boxes; and the AS/400 and mainframes. CA-Unicenter/DB Alert and Systems Alert allows administrators to detect, identify and correct problems before they affect the performance of database and operating systems.

CA has also cut prices for small users or small departments within large organizations, while restructuring its licensing policy for large users. "Our pricing was such that volume discounts were applied independently to each platform," Gupta says. Now a customer can combine all platforms in a single contract, which makes Unicenter more attractive for large users with heterogeneous machines.

CA also has lowered prices for the CA-Ingres database. Although everyone agreed that Ingres was the best database, it was also higher priced than anything else, says Alan Paller, director of open systems. The ASK Group couldn't afford to charge less, he explains, but that's no obstacle for a company the size of CA. To prove it, this past September, CA cut prices for CA-Ingres by up to 60 percent. "Now you have to pay a significant premium for either Sybase or Oracle," Paller notes.

Ingres was a "good fit" for CA

for four reasons: a loyal customer base; superior application development tools; the best available data replication technology and the stability of the product. "There was an uncertainty in the industry about whether or not CA would be able to add value to Ingres or whether we were buying it just to add that customer base to our own," Paller says. "That uncertainty was mistaken. We bought it to be an underlying technology for our own products."

Since June 1994, CA has added value in three areas. "We have added new functions that make it particularly good in mission-critical applications," Paller says. "And we introduced a version for the Windows environment. Third, we improved the performance of the client version for client-server applications by 300 percent."

When it comes to HP, Gupta and Paller agree there is a good deal of synergy. CA-Unicenter was available for HP platforms before any other. And Ingres is bundled with HP's OpenView. According to Paller, "It's the underlying repository for many OpenView sites, so it has been optimized for that. For the kinds of things we're adding to the database, that's the right place for us."

Bit

Pump Up Your Interfaces

by

With GUI Builders

The move from character-mode terminals to desktop PCs is good news for most knowledge workers, but it weighs heavy on the shoulders of the corporate software developers who must support their efforts. Programming for a GUI environment is an order of magnitude more complex than programming for character-based applications. That problem is exacerbated by the fact that users' expectations about ease-of-use rise substantially when they use a graphical workstation or PC.

As user interfaces have become more complex, the tools for building them have become more comprehensive and easier to use. Rather than coding, compiling and testing pages of dense, low-level interface code, developers now work within clean, well-supported visual development environments.

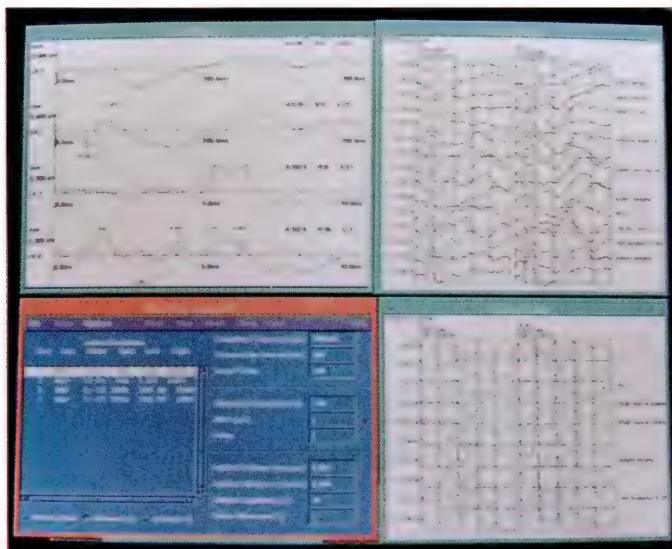

Drawing from class libraries of widgets and controls, pointing-and-clicking their way through thousands of colors and fonts, buttons, list boxes and menus, developers are constructing elegant user interfaces — all with little or no coding.

Commonly called GUI builders, these products drastically simplify the process of building bit-mapped interfaces for graphical, windowing systems such as Microsoft Windows and Motif. There are two basic types of GUI building products: interactive design tools (IDT) and user interface management systems (UIMS).

INTERACTIVE DESIGN TOOLS

INTERACTIVE DESIGN TOOLS offer various pre-built objects for user interface development. Their focus is the interface and nothing but the interface. After completing a design session with an IDT, the actual interface code is generated automatically, typically in C, C++ or the Motif User Interface Language (UIL). Developers must write all the additional code to bring the interface to life, either in the native language or with third-party tools.

IDTs are a good choice for iterative GUI development efforts where user and developer need to work side by side, says Bill Madden, a systems software engineer at Computational Diagnostics Inc. (CDI; Pittsburgh, Pa.), an HP value-added reseller in the medical arena. "Users can sit down with developers and give them immediate feedback, do workflow analysis and sug-

CDI's NeuroNet provides real-time acquisition, analysis and display of neurophysiological data during brain surgery.

gest changes which can be implemented immediately," Madden says.

Madden used Imperial Software Technology Inc.'s (Reading, United Kingdom) X-Designer to create a sophisticated user interface for CDI's NeuroNet product, which provides real-time acquisition, analysis and display of neurophysiological data during brain surgery. He created dozens of user friendly screen displays from X-Designer's packaged controls, then created a few unique instrumentation widgets with the X-Designer widget builder.

"We wrote 11,000 lines of bug-free interface code in two days," Madden says. "That would have been months of work without a GUI builder." The interface consists of dozens of Motif widgets, including cascading menus, push and toggle buttons, row-column widgets and a scrolling list widget.

The users of the NeuroNet system are not computer specialists, so a GUI was essential. "They needed an easy and effective way to visualize changes to the nervous system through an intuitive user interface," Madden says. "X-Designer allowed us to quickly create controls that mimic the displays from equipment and instruments they are already familiar with."

USER INTERFACE MANAGEMENT SYSTEMS

UNLIKE INTERACTIVE DESIGN tools, UIMS typically include some type of language interpreter and compilation environment for creating application logic along with the interface. These extra capabilities let you interactively test the behavior of an interface as you build it. Because these tools automate a larger portion of the life cycle and allow you to actively test your designs as working applications, some developers say they can create better interfaces. On the other hand, UIMS are usually based on a proprietary language, similar to some 4GL tools.

To qualify as a UIMS, a GUI builder must have three characteristics, says Mike Foody, president of Visual Edge Software Ltd. (St. Laurent, Quebec). The first is a complete set of controls which can be used right out of the box to construct standard interface

PREFAB SOFTWARE DEVELOPMENT

Hand in hand with the rising popularity of GUI builders is the emergence of a companion industry for user interface widgets. Widgets are pre-built objects, or user interface controls, that can be pulled intact into applications. Often, incorporating off-the-shelf widgets into an application is the next logical step after user interface development with a GUI builder.

"Software development is becoming more and more like a factory," notes Ian Kent, a system architect at Bell Northern Research (BNR), the research arm of Northern Telecom (Ottawa, Ontario), a major telecommunications switching supplier. "Developers are buying more and more and building less and less. It is similar to what has been happening in the manufacturing world for a long time."

BNR, for example, uses C++ and X-Motif to develop applications for analyzing and visualizing result data from the operation and testing of BNR switches. Developers, such as Kent, perform high-level analysis, design and requirements planning, then play the role of integrators piecing together specific applications from prefabricated components. "We buy off-the-shelf objects for as many parts of each application as we can," says Kent.

General purpose objects that BNR can't find ready-made are custom crafted by a software development shop in India. Anything that's left, such as unique logic and controls that pertain to their switching business, they create from scratch using native C++ code on HP 9000 Series 300, 400 and 700 workstations running the HP-UX 9.0 operating system.

"We try to stick to our domain, which is analyzing the results produced by switches," Kent emphasizes. "Anything that fits into a general domain, such as strings, dates or graphs, we find it much more cost effective to buy ready-made. This way, we can focus our development efforts on the strategic aspects of the business that we know best."

BNR uses XRT Widgets from the KL Group (Toronto, Ontario) like: XRT/3d to perform 3D surface, contour and bar graphing; XRT/table to display and edit tabular information; and XRT/graph for two-dimensional graphs, pie charts and X-Y plots.

Two other popular vendors of widgets for Motif developers are Integrated Computer Solutions Inc. (ICS; Cambridge, Mass.) and Non Standard Logic Inc. Building on the basic Motif toolkit, the ICS EnhancementPak provides 16 additional widgets, including Button Box, Color Selector, Font Selector, Icon Box, Pixmap Editor and Toolbar. NSL offers the Widget Library as well as the Widget Factory for constructing custom widgets and interface components.

— DB

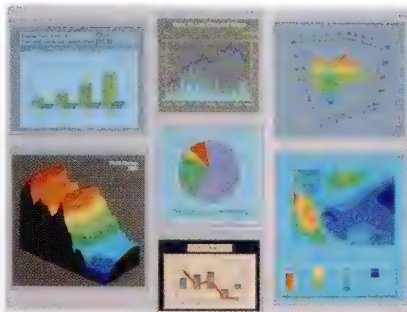

items such as pop-up windows, pull-down menus, text fields, sliders and buttons.

The second characteristic is a well-developed add-on market of third-party controls to perform specific functions, such as widgets for statistical mapping, tabular display of data and 3D graphing. The last characteristic is a development environment allowing developers to build their own user interface controls.

For example, a developer at a financial brokerage house might create a stock-quote control that monitors market information; while a developer in a manufacturing plant might create an instrumentation control that looks and behaves like a pressure gauge.

Examples of UIMS products include: XFaceMaker from Non Standard Logic Inc. (Boston, Mass.); UIM/X from Visual Edge Software Ltd; ezX from Sunrise Software International (Middletown, R.I.); and Builder Xcessory from Integrated Computer Solutions (ICS; Cambridge, Mass.).

With their customizing capabilities,

For the GUI, the interface must be as flexible as its users are diversified.

UIMS are often used by software developers to add complete Motif GUI development capabilities to their products. For example, Visual Numerics Inc. (Boulder, Colo.) has integrated Visual Edge's UIM/X product with PV-WAVE, its visual data analysis (VDA) software.

PV-WAVE's user interface widgets are designed for single users or small groups of users, but to create a corporate-wide interface, they are often immersed in X Windows or Motif toolkit coding, explains Shawn Javid, PV-WAVE product manager. "UIM/X extends the PV-WAVE environment to include an integrated GUI development environment," he says. Developers use UIM/X to incorporate PV-WAVE functions into a complete Motif interface."

A WINDOWS LEIT- MOTIF

PORTABILITY between the UNIX and Windows environments was a big concern

Client/Server Makeover in Minutes!

Rejuvenate the look of your legacy programs automatically — simply apply Faces to your applications and watch it work wonders in minutes. Protect system investments by adding graphical interface application productivity.

Fine-tune your Faces screens, or go to work immediately: with Faces the choice is yours. Point and click tools make customizing screens a breeze.

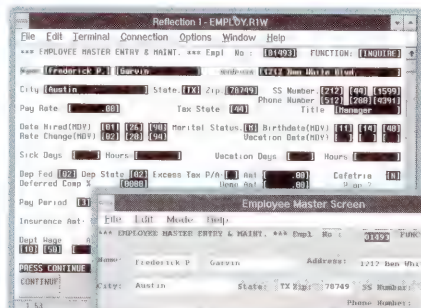

Ready-to-use buttons and objects are included, or quickly add buttons to do specialized functions. A simple brush of Faces over your legacy programs gives them the easy-access look your users need without any application changes.

Faces allows you to:

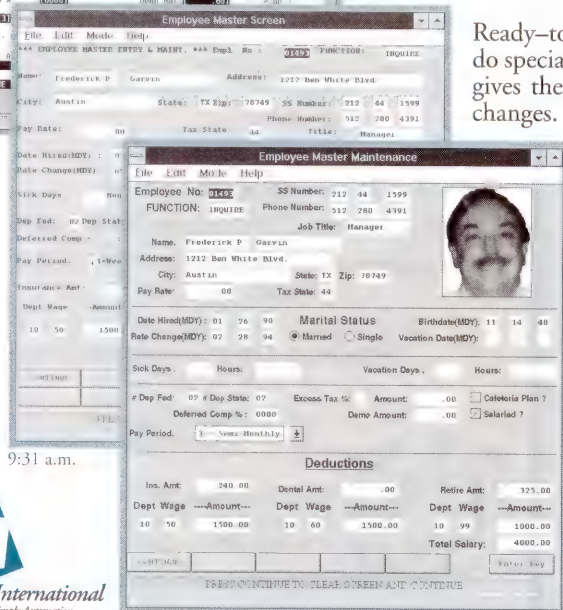

- ☐ Link legacy applications to Windows applications like Excel or Lotus 1-2-3.
- ☐ Create on-line hypertext help for all legacy applications.
- ☐ Build applications directly from any ODBC/SQL database (including IMAGE and IMAGE/SQL).
- ☐ Update multiple databases from a single screen.
- ☐ Interface E-mail systems, and much more...

for Visual Numerics and CDI. Although CDI's NeuroNet is being developed and deployed on HP 9000 workstations, Madden plans to port the entire system to the Windows platform as well. That illustrates an important trend in the Motif GUI development market — even die-hard UNIX shops are keeping their options open to include an eventual Windows migration.

An upcoming version of X-Designer will allow them to regenerate their existing UNIX code for Windows, Madden says, converting X Designer widgets and controls from Motif classes to the equivalent Microsoft foundation classes. GUI builder vendors are responding with widgets and controls that are cross-platform ready right out of the box, as well as with development environments for building new cross-platform widgets and controls from scratch. But vendors differ widely in the degree to which they have simplified the process of actually porting complete user interfaces from one GUI to another.

"Unfortunately, there are distinct differences between Windows and Motif, which results in a lowest common denominator of commonality," Foody says. "If you want a truly portable interface, you are limited in how deep you can go into either GUI."

Some GUI builder vendors solve this dilemma by shipping two

There are five areas of coding in a client-server development effort: the GUI, the SQL statement, business rules, the connection and rules for SQL.

distinct versions of each control, one for Motif and one for Windows. When developers construct new controls, they reference a

portable API that comes with the GUI building product, and the API sorts out the differences between the two platforms. But developers still need extensive knowledge of the nuances of each GUI environment if they wish to build a slick, cross-platform interface. Foody admits. "No matter what tool you use, there is still a fair amount of hand coding and tweaking that must be done. Developers must know each deployment platform well in order to do a good job."

STEPPING THROUGH THE LIFE CYCLE

AS SOPHISTICATED AS GUI builders have become for user interface development, it is important to remember that they still automate only a small portion of the application development process. There are five areas where coding is normally required in any serious client-server development effort:

- ▶ 1. The GUI, including the menus, dialogues and other interface objects;
- ▶ 2. SQL statements that are executed to insert, retrieve, delete or update data;
- ▶ 3. Business rules, which determine just what the application actually does;
- ▶ 4. The connections between the business rules and the GUI,

which determine the action that the interface takes when an event such as a mouse click occurs;

- ▶ 5. Rules for SQL, which determine what is done with data once it is retrieved (where and how it is displayed)

Different tools exist for automating each of these phases, and some can automate several. 4GL products such as Powersoft Corp.'s (Concord, Mass.) PowerBuilder, for example, have excellent user interface development capabilities, and can go on to automate each of the other four portions of the application to some degree.

But, unlike a GUI builder, once you are through with the PowerBuilder development process, your interface is dependent on PowerBuilder, a proprietary solution. GUI builders remain popular because they generate standard code, such as C or C++, meaning developers aren't necessarily locked into a proprietary environment for the remainder of the development process. It also means that it's easier to integrate that interface into many different types of C-based applications.

"A GUI builder gives you more flexibility," Foody adds. "If you start in a 4GL, you have to remain in that 4GL. But if you start in a standard language, such as C or C++, you can take any number of roads to complete the application."

GUI builders also tend to construct more polished user interfaces than visual 4GL products, because that is their primary

MegaRam: The Highest Performance Storage Peripherals Available.

The Proof Is In the Specs...

- 1/30th Millisecond Access Time
- 10 MB/Second Transfer Rate/Port
- 3 1/2", 5 1/4" or 8" Form Factors
- SCSI, DSSI or Custom Interface
- 16 MByte to 3 Gigabyte Capacity
- Multi-Porting
- Redundant Power Supplies

focus. And while some GUI builders have compilation environments and language interpreters to create rudimentary business logic, they all offer links to other development tools and third-party utilities.

For example, BlueStone Consulting (Mount Laurel, N.J.), a software firm, bundles sophisticated database development capabilities with the UIM/X GUI builder to create a product called db-UIM/X. This allows developers to create relational database transactions and attach database access logic to fields and events in the GUI without having to drop down into a low-level language. There also are application frameworks, such as HP SoftBench, that include GUI builders as well as configuration controls, modeling tools, text editors, browsers, database managers and debuggers.

"The lines between the different types of development tools are beginning to blur," Foody concludes. "People don't want to build GUIs. They want to build applications. In that sense, all GUI tools are becoming more solution oriented."—David Baum is a freelance business writer based in Santa Barbara, Calif. who writes about information technology. 4.9%

If 25,000 AS/400® applications aren't enough to impress you, how about these numbers?

64-bit

Beginning February 1, 1995, the Advanced Technology Lease from IBM is making it possible to upgrade or acquire a new AS/400 Advanced System at rates as low as 4.9% for 36 months. You'll also have the option to add 64-bit RISC technology by simply extending your low monthly payments while paying no additional software upgrade charge.

This offer is being made available by IBM Credit Corporation. For more information, call 1 800 IBM 3333, ext. BA111, or contact your local IBM marketing representative. Because numbers like these on AS/400 don't come around every day.

Financing available to commercial and government customers only and will vary based on customer's credit rating, financing terms and lease terms selected. 4.9% financing applies to best credit rating on 24- or 36-month term lease. Advanced Technology Lease available only on 36-month term lease. Offer applies to selected systems ordered after 2/1/95 and installed by 6/30/95. These rates are available through 3/31/95. Restrictions may apply. Offer may be withdrawn at any time.IBM and AS/400 are registered trademarks of International Business Machines Corporation. ©1995 IBM Corp.

GUIs Paint A

Picture's Worth

of Information

at one time, graphical user interfaces (GUIs) were called WIMPy, WIMPy, WIMPy, after the terms that made up the acronym: Windows, Icons, Menus and Pointing devices. They were treated with disdain by programmers; users were indifferent. But the success of the Apple Macintosh and now Microsoft's Windows on PCs has made GUIs quite acceptable, if not the technology to obtain.

In 1990, market researchers Temple, Barker and Sloane Inc. (Lexington, Mass.) did a study of white-collar employees working on character-based and graphical user interfaces. They found that both novice and experienced computer users worked faster and made

After A Network Problem Threatened To Shut Down His Company's Mission-Critical Applications, WHAT DID DAVE DO?

That's because there was really no reason to worry. Dave, like managers at more than 3,000 organizations around the world, knew he could depend on Unison Software's networked systems management solutions to keep not only his mission-critical applications running, but all his other processing as well. Unison's products were designed for distributed systems from the outset—redundant management platforms take over if there's a failure of the primary host or network links

to the primary. Unison Maestro, Load Balancer and Express are reliable, commercial-strength workload management products for distributed computing. Across both the network and the enterprise. On all the most popular UNIX and open systems platforms. And the products are supported by Unison's nearly 10 years of experience helping companies manage demanding commercial processing environments. So if you'd rather have your managers going to lunch instead of going berserk, call Unison Software today.

fewer mistakes with GUIs. And learning new tasks was easier too.

But, in a 1992 survey by the Microcomputer Managers Association (MMA; Warren, N.J.) entitled "The Real Cost of the Graphical User Interface," only 51 percent of the IS managers polled reported increased staff productivity with a GUI. Forty percent cited no gain in productivity, while 9 percent suffered productivity losses. How come?

The MMA concluded that "Many organizations consider GUIs a strategic cost of continuing to do business ... the necessary price of remaining competitive in an environment of unremitting change." So if you're an IS manager wondering about the benefits of GUIs, remember: GUIs provide the *potential* for increased usability.

"GUI elements do potentially enhance usability," says Deborah J. Mayhew, author of *Principles and Guidelines in Software User Interface Design*. "You can measure in an objective way the increased usability of a [graphical user] interface.

"It's very easy to design a bad graphical interface," says Mayhew. "You have so many ways to go wrong [clever but unlabeled icons, radio buttons with cryptic text] and so many more capabilities [pull-down lists hiding essential information; unexpected pop-up dialog boxes], that it's possible to make a vastly more confusing interface."

The Good, The Bad And The Usable

THE FIRST STEP IS understanding what usability is, and what it isn't. According to Brad Hesse, co-director of the Center for Research on Technology (Palo Alto, Calif.), usability has two components. The first is efficiency. How effectively are people able to use the product? The second is emotional. "How effectively satisfying is the experience? People have to *like* the product.

"A usable product is compatible with a user's information processing abilities," suggests Hesse. Not surprisingly, the same factors that contribute to application efficiency make it less frustrating and more likable. Consistency, for example. "The key to usability is doing things in a standard fashion, so that there are few surprises," says Dave Gordon, principal at Blue Ox Software (Burke, Va.) "The pedals in a car, for example, present a standard interface. The pedal on the right is always the gas, the one in the middle is the brake, and the one on the left is the clutch. Eventually, we'll get smart enough to make software the same way."

The "pizazz" of a graphical interface — cute icons, 3D buttons, shrinking and exploding windows — has to contribute to effective use. Otherwise, it gets in the way. Users tend to be irritated by arrays of colorfully confusing icons or audible

Figure 1

Figure 2

error signals that provide no help in correcting or recovering from the error. "A bad GUI," says Hesse, "leads people down wrong roads or into blind alleys."

Usability does not happen by chance. There's "a whole bag of methodological tricks that allow us to develop more usable interfaces," says Mayhew. She recommends integrating specified usability tasks into the normal software development life cycle.

Define the scope of the development, including a user profile. Typical profile characteristics include things like the level of user education and even typing skill. It's also important to know whether or not the users will be trained, and how frequently they will use the software.

Very frequent users, says Mayhew, can learn things in spite of the design. "Because they interact with the application so often, they're more interested in speed and efficiency than in

This began as a couple of atoms.

**And this began as
a word processor.**

**As a Hewlett-Packard user, your chance to
cash in on its popularity begins now.**

WordPerfect for UNIX may have begun as a powerful, native word processor, but it's become much more. Now you can have all the tools you need to seamlessly process documents within one application. Spreadsheet functions, document management and graphics editing tools, combined with powerful word processing capabilities, make WordPerfect 6.0 for UNIX the world's first document processor.

There's even more exciting news: For a limited time, Hewlett-Packard users can trade up to WordPerfect 6.0 for UNIX from

other word processors for just \$149*. That's 70% off the suggested retail price of \$495! And for those who would like to upgrade from any previous version of WordPerfect, a special upgrade package is available for only \$129.

There won't be a better time for Hewlett-Packard users to get a hold of the most popular word processor for UNIX. But hurry, your opportunity to take advantage of this offer ends soon. Be sure to call **(800) 321-3280**, and order your package before the sun sets on this extraordinary offer.

Pretty Interface

ease-of-learning.” Intermittent users, on the other hand, require that the software be easy to learn and to remember. For them, speed and efficiency are secondary to learning ease.

Develop functional specifications that include task analysis and usability goal setting. Task analysis — understanding the work to be supported by the software — is essential. “If you don’t understand how the work flows and how the workers think about their work, you design in the dark,” says Mayhew. “You may provide the required functionality, but end up structuring it in a way that makes it extremely tedious, confusing or error-prone.”

Set objective, measurable goals for usability. Plan so that a key task should not take any longer than X amount of seconds or Y amount of minutes. Users should not, even in the learning phase, make more than a specified number of errors. “You can manipulate the design until the goals are met,” says Mayhew. “That’s how you know when to stop testing.”

Mock-up and test the preliminary user interface design. At this stage, the fastest, most effective route is low-tech; paper and pencil mock-ups work very well. The user mock-up doesn’t have to be done on a prototyping tool.

Check the preliminary design with a user interface walk-through. “You’re checking to answer important questions,” says Mayhew. “For example, does this design tap into the users’ current mental models of the work that they do? Does it make sense to them?”

A UNIX FACE IN A JAR

UNIX-based GUI development is conceptually no different from GUI development for other platforms. The basic considerations are the same: task analysis, user profiles and feedback. The trick is to take advantage of the multiuser, multitasking capabilities of UNIX while also taking advantage of a GUI’s ease of use. “Usability,” says Peter Winston, president of Integrated Computer Solutions Inc. (Cambridge, Mass.), “is a programmer’s ability to make an application intuitive for the user.”

UNIX intuitive? Well, it can be, when you disguise the command line with a graphical face. “From a UNIX perspective, the user interface stack is three-tiered,” says Jon Brewster, section manager at HP’s Corvallis Software Lab (Corvallis, Ore.). “There’s the core X Window system; the Motif toolkit, the parts with which you build higher-level full-service entities; and the [graphical] desktop, such as HP VUE, that make up the total user environment.”

A single-solution common desktop environment (CDE) is an important part of UNIX GUI development, says Brewster. “We want a single desktop implementation that is shared by all the competitors in the UNIX business.”

As you might guess, behind every easy-to-use interface is a lot of hard-to-write code. “Going from command line interfaces to GUI quadruples program size,” says Winston. “GUIs manipulate a lot of things that command

Figure 3

Prototype and test the user interface design. After evaluating and refining the high-level mock-ups, you’re ready for detailed user interface design and formal usability testing. Build a live, interactive, working prototype. Work with representative users performing representative tasks. Time their performance.

Track the number and types of errors they make. “I use the ‘stand-over-the-shoulder’ approach,” says Gordon. If users get up to speed quickly, he says, “then I know I’ve done a pretty good job. If they come up against blind alleys, I know I need to reorganize.”

Watch the steps users go through while working with the

line interfaces don’t have to worry about.” Winston cites several ways to make the most of your UNIX GUI development resources:

- Think about the interface first. “Most developers,” says Winston, “think first about what they want the program to do. Then they think about how they want the program to operate, and what user input is required. Finally, they think about the interface. That’s 100 percent wrong.”
- Make sure your application is object-oriented. Reusable objects bring consistency up and cost down.
- Select a tool with a palette of the right objects. For example, Motif lets you have icons or labels, but not both. Usability calls for an object set that allows both.

“This is a UNIX environment. That makes it fun,” says Brewster. “You have to allow the system administrator to install applications where they run best on the network without affecting how the user interacts with them or what the ISV does with them. You also need to integrate security into the environment unobtrusively [to the user], but without interfering with the system administrator’s ability to control workgroup and individual access to the system.” —JH

Usability doesn't come for free. A cost-benefit analysis involves selecting which usability tasks you can afford. You have to decide between quick and simple, or rigorous and complex.

product. Did all users get confused at the same point? Could they find what they needed? Did they have difficulty performing a task that is fairly simple in the manual world?

Compare their performance against your usability goals. Analyze any discrepancies; then go back and design the problems out of the interface.

Run that play until you get it right. Interface design and functionality integration go on in parallel. The user interface design now becomes an iterative process: design and test; then go back, redesign and test again. While the interface is being designed, developed and tested, other members of the project

are performing function and data modeling, fleshing out all the details for the required functionality.

Usability doesn't come for free. A cost-benefit analysis typically involves selecting which usability tasks you can afford to do on a given project. You have to decide between quick and simple, or rigorous and complex, maintains Mayhew. "But it's usually laughably easy to cost-justify fairly major expenditures on usability." Shaving one second off the time required for a single transaction doesn't sound like much. But if you have 1,000 users, with each user churning out 50 transactions a day, those shaved seconds begin to add up to hours.—*Judith Harper is a freelance writer based in Cincinnati, Ohio. The Day Of The Dolphin

HP Laboratories in Bristol, England has unveiled a patent-

pending model-based reasoning technology, code-named "Dolphin," that will enable HP products to support centralized configuration and administration of heterogeneous client-server environments.

This new technology uses object-oriented concepts, such as class and inheritance, to help mask differences in underlying operating systems and hardware from the administrators responsible for managing those systems.

Ask any systems administrator what it's like to maintain some sort of centralized control in a large, geographically-dispersed, mixed-vendor network, and you'll find out right away why Dolphin could easily help HP swim away with a sizable chunk of the growing market for UNIX systems administration tools.

The first incarnation of Dolphin in an HP product will occur next month, when HP ships the first release of HP AdminCenter. Announced in November 1994, AdminCenter joins OperationsCenter and HP PerfView as the third of a trio of major systems management products designed to complement HP's flagship network management offering, HP OpenView.

HP OperationsCenter is a high-end

product that consolidates asynchronous messages from UNIX systems, automating much of the process of digging through obscure UNIX logfiles to determine the status of critical system resources such as swap space, CPU utilization and disk I/O processes. HP PerfView and its associated utilities, Performance Collection Software (PCS) and GlancePlus, let UNIX gurus drill down and analyze in great detail the performance of UNIX servers and high-end workstations.

AdminCenter is different from OperationsCenter and PerfView in that it targets configuration and change control of software, peripherals, file systems and even user-related data. In particular, the Dolphin technology will allow AdminCenter to tackle the very knotty problem of simplifying user administration in mixed environments.

In an all HP-UX environment, for example, an organization may get by with one or several HP-UX gurus to handle the process of assigning user IDs, passwords and privileges, network IDs and ensuring users have the right software loaded onto their workstations. But in large geographically dispersed networks supporting several flavors of UNIX as well as NetWare, it may well be cost-prohibitive to place multiple systems administrators, versed in the various operating systems, at each site.

This is precisely the kind of environment where AdminCenter should be cost-effective. The product supports a "process-oriented approach" to centralizing and automating the configuration of UNIX systems and servers, users/

HP has beat IBM to the gate when it comes to user administration in heterogeneous (including non-IBM) environments.

passwords, filesystems and software.

AdminCenter is process-oriented because it gives the customer a single, unified interface to the process of configuration across a potentially diverse set of entities — including devices, software, systems, subsystems and users. As a result, HP customers will not need to deploy a different procedure for configuring each individual type of managed object in the environment of networked systems.

The ability to provide a consistent look-and-feel across a diverse set of management products has been a major selling point of the entire HP OpenView/OperationsCenter product suite. The new AdminCenter product will reinforce that competitive advantage for HP.

How well does AdminCenter stack up

to the competition? HP's product is similar in nature to Tivoli's Admin, a policy-based user administration and security tool that takes advantage of Tivoli's object-oriented framework. Tivoli/Admin has been out for well over a year, but HP will have the advantage of offering HP AdminCenter as part of a broader suite of network and systems management solutions. While Tivoli's Enterprise Console directly competes with HP OperationsCenter and Tivoli/Sentry provides some level of performance analysis, HP PerfView and the associated PCS and GlancePlus products are considered by many to be tops in UNIX performance analysis.

And what about IBM? We've been hearing for sometime that IBM will be rolling out a suite of object-oriented net-

work and systems management applications for mainframe, AIX, OS/2 and NetWare environments. However, timing is everything and HP has beat IBM to the gate when it comes to user administration in heterogeneous (including non-IBM) environments. IBM also lacks a message consolidation product similar to OperationsCenter for the UNIX environment.

Today, the level of integration between the various HP systems and network management tools is only skin-deep overall. However, that's still an improvement over what most customers must deal with today — lots of different end-user interfaces to lots of disparate products. But, according to HP, Dolphin will enable new levels of integration between HP OpenView product family members, as well as third-party applications.

"The Power is in your Hands!"

Learn how to transform your workplace with . . .

The Phoenix Agenda: Power to Transform Your Workplace

by John Whiteside

"The core of this book is a powerful protocol for human-to-human communications, especially designed for those of us in the high tech field."

- Jim Povec, Chief Operating Officer, Cardinal Business Media Inc.

"The Phoenix Agenda offers the manager a first step into life as a leader..."

- Marcus T. Wilson, G.M., Intel Corporation

With the shifting set of workplace rules, constant turmoil and job uncertainty, managers are challenged to adopt distinctively new roles while dramatically improving their personal and corporate performance. In *The Phoenix Agenda*, Whiteside shows managers how to move into these new roles while enabling their companies to work more effectively within the framework of high performance work teams.

Based on Whiteside's personal experiences with companies such as Digital, American Express and Intel, *The Phoenix Agenda* reveals a proven, 12-step approach for effectively renewing companies in the face of turbulent change.

Take Control and Transform Your Workplace.

Sticking To The Top-ic

The **top** command is this month's top-ic. I found it while at a customer

site when I saw someone run it during a class (thanks, Paula). This was after I wrote the last column dealing with some scripts for looking at processes. So I hope this is a good followup.

Top stands for "top processes." It will display a periodically updated list of processes running on the system, and rank them from highest percentage of raw CPU utilization to lowest CPU usage. There are options for period of delay between updates: (**-snumber**); how many times to perform and update: (**-dcount**) then exit; and run in CPU hog mode: (**-q**) — when the system can't keep up with the analysis tool itself.

Options to speed it up include: **-u**

(UID), which prevents the system from translating UID to user name; and **-nnumber** which only displays **number** processes per screen. The **-n** option implies that there may be multiple screens, and you will need some screen control commands.

You emacs bigots will hate this, but the screen control commands are similar to the vi editors. Once **top** is running, **j** (up) shows the previous screen, and **k** (down) shows the next screen. **t** is a quick way to get back to the first (top) screen, and the highest CPU hogs. The problem with the screen control commands, is that they don't take effect until the next screen update, which is 5 seconds by default, which is really obnoxious if you have been drinking coffee. To terminate the program, just hit the **q** key, like you would in the **more** command.

DECIPHERING THE OUTPUT

There are three sections to the output: system data, memory data and process data. *Figure 1* shows a sample output screen from the following command line:

top -s2 -n10. The first five lines are the system data.

Line 1 is the host name. Line 2 gives load average over the last one, five and 15 minutes. This information is the same as that given by the **uptime** command (discussed in my December 1994 column). Line 3 lists processes running, and shows how many are in which state (sleeping, waiting, running, starting, zombie and stopped). Note: if a user

There Is A Better Way To Access Your Data

VISIMAGE — The Right Tool for Report Writing Won't Hammer Your System

Visimage, the original client-server report writer in the HP market, keeps getting better. Visimage now provides a Microsoft® Windows™ interface. Familiar mouse-driven icons empower users to select, report and download data in a controlled environment. Visimage is easy to set up and easy to use. Advanced reporting capabilities assure that users never outgrow the power of Visimage.

Our unique client-server technology minimizes resource demand through serial or network connections. Data remains on the host server, maintaining security and accuracy while eliminating potential network overloads. Users can schedule Visimage reports on the host that run independently of their PCs. Efficient data retrieval can be further enhanced by integration with HP third party indexing tools.

Choose Visimage, the right tool to access IMAGE, IMAGE/SQL, ALLBASE, ORACLE®, KSAM, C-ISAM® and flat files on your HP 3000 or HP 9000 computer.

HP, HP 3000, HP 9000, IMAGE, IMAGE/SQL, ALLBASE, and KSAM are products of Hewlett-Packard Company. MS-DOS is a registered trademark and Windows is a trademark of Microsoft Corporation. ORACLE is a registered trademark of Oracle Corporation. C-ISAM is a registered trademark of Informix Software, Inc. VISIMAGE PC and Visimage for Windows are trademarks of ARES, France.

does a CTRL-Z and stops a process, it is listed as running, not stopped.

Lines 4 and 5 show CPU state information. This line details what percentage of time is spent in each of the processor states (user, nice, system and idle). I do not have any multiprocessor machines, but the man page says it would be per processor. This can be important in determining why a machine is dogging it.

Figure 2 has some samples of this line when various loads were put on the system. I like to use very simple tests when experimenting with any performance tool, because I can decide where the test will put the load, then be sure the tool proves the desired result. Then I can apply known symptoms to an unknown problem. Here are the commands that were applied to get the results in Figure 2. Use the numbers to pair them up.

FIGURE 2

```
1 Cpu states: 57.8% user, 42.2% system, 0.0% idle
2 Cpu states: 70.8% user, 29.2% system, 0.0% idle
3 Cpu states: 74.5% user, 6.6% system, 18.9% idle
4 Cpu states: 26.2% user, 73.8% system, 0.0% idle
5 Cpu states: 4.9% user, 1.0% system, 94.2% idle
```

**The screen control
commands don't take effect
until the next screen update,
5 seconds by default, which
is obnoxious if you've been
drinking coffee.**

1. while true;do cat textfile;done
2. same as above, also Lotus Ami Pro startup
3. just Lotus Ami Pro during startup
4. while true;do cat textfile>/dev/null;done
5. same as 4, but during extreme network load

SO WHAT'S HAPPENING?

Some interesting things are happening here. In test 1, we were fairly balanced between system and user process time. We were

passing a lot of data from the disk (then memory, after the file became resident and static) to the process to the tty to X windows. The two top processes were X and the HPterm, not the korn shell — it was way down the list. This should imply the bottleneck was displaying the data, not getting it. Indeed if you look at test 4, the user time drops dramatically, the load is on system processes, as we were displaying no data. The top process in this case was the korn shell.

Test 2 shows a combined effort of starting the Ami Pro word processor (it is an effort) and still doing the **while** loop **cat** command. Looking at test 3, which was just Ami Pro, we can see much higher user time, as the files needed had already been read, we were building internal tables, and some temporary files to prepare for editing files. In test 2, X was the top process, and Ami Pro was in test 3.

Test 5 was to show a poorly responding process (due to network problems, and accessing a remote host), but were a user to use another window/application, response would have been good. The process that was acting slow was actually the 8th top process in this case, and the system was mostly idle.

The next section of output in Figure 1 is the memory data. Listed is real and virtual memory in use, with active amounts in parentheses. If the amount of memory in use never approaches that physically in the machine, you are not memory bound — just busy. Figure 1 shows a machine with 32 MB of memory in use, never exceeding 12 MB.

The last section of output in Figure 1 is the process data. Here is the listing of processes in order, with percentage of CPU time usage. Much of the output data is the same as given with the **-l** option to **ps**. I am not sure of the algorithm used to get the weighted CPU time versus raw CPU time. Where the process is not bound by any type of I/O, the weighted value appears to go up. If you know, please enlighten me.

A WORM BY ANY OTHER NAME

I recently attended a meeting for all the UKW (Underwater Knoters of Worms) of the southeast portion of the western section of Corpus Christi, Texas. There were well over 300 knoters there. And with all the practicing going on (it was a bad day for worms) it took a while for the speaker at the aqua-podium to get everyone's attention. When everyone finally surfaced, stopped blowing bubbles and generally quieted down, the speech began. But very quickly everyone began fidgeting once again. Soon almost everyone was back to trickily twisting worms, totally ignoring the speaker.

How was I to know that the UKW (United Kingdom Workstation) group was meeting in the conference room — **and not in the pool room?**

It doesn't feel that good to be talking when no one's listening (stick with me, there is a point to all this.) But there was nothing wrong with my speech. The problem was a mismatch between the audience and speaker. But, I know of one place where there will not be a mismatch between a speaker and audience. And just to be sure, I would like to meet all of you who read this column at the InterWorks Annual Conference scheduled to held on on May 7, 1995 in Phoenix, Ariz.

InterWorks is for the technical HP-UX audience. If you are a HP-UX programmer, system administrator, network manager or other technical sort, then this conference is for you. There will be 56 hours of user and HP presentations, 24 hours of tutorials (including two-hour how-to's), a technical lab area for communing with the engineers that develop or support the HP products that you use, love or curse.

It also is a chance to meet the HP Response Center people face-to-face, give your feedback and suggestions to HP through the Engineering Investments session, and way more good stuff than my editor will let me list here. But most importantly, this is a place to go and meet your peers in the industry, and hear presentations that are planned, and written by the right speakers, for you, the right audience. —FM

Davox Corporation

Version 3.2
Now Available!

"Our customers depend on our Intelligent Workstation Solution to keep their business going. We depend on DynaComm for the largest variety of terminal emulators and network connectors, full DDE capability and ease of use."

DynaComm delivers for Davox.

Davox Corporation is a worldwide provider of unique, unified solutions for customer contact operations.

At FutureSoft, we know that PC connectivity has become a critical component in enterprise-wide computing. Our DynaComm product family provides extensive terminal emulation and network connectivity solutions for both asynchronous and IBM mainframe environments.

Take advantage of over a decade of experience and discover what Davox, Thoroughbred, Digital, Hewlett-Packard and numerous Fortune 500 companies already know.

Our latest version has all the features that serious computing environments demand:

- ◆ Optional support for Microsoft's Visual Basic
- ◆ User desktop tools which are easy to configure and support
- ◆ Selective, DLL-based installation on your PC or server to minimize application footprint
- ◆ Graphical tools including dialog editor and keyboard mapper for easy interface customization
- ◆ Scripting capability to call external DLLs which is unequalled in the industry

The Ultimate in Power and Flexibility

Novell Ups The Networking Ante

Novell appears to have gotten back on track with NetWare 4.1, the

latest upgrade to its network operating system. NetWare 4.1, in fact, delivers features that make it "a definite leap" over its predecessor, according to one beta tester.

For starters, Novell (Provo, Utah) has made NetWare 4.1's NetWare Directory Services (NDS) more flexible and easier to manage. Just as importantly, Novell has lowered NetWare 4.1's prices and switched to "additive" pricing, letting end users buy various multiuser licenses, such as five- and 100-user packages, and consolidate them into odd-lot bundles.

Novell also filled in a number of other gaps that left NetWare 4.01 incomplete. These include tools to migrate from 3.x, integrated TCP/IP, E-mail and Macintosh support, a more efficient wide area routing protocol called NetWare Link Service Protocol (NLSP), and easier NetWare 4.1 installation.

OVERCOMING RESISTANCE

The key factor in end-user resistance to NetWare 4.01 was NDS, a global database of end users similar to Banyan's Street Talk. Novell's first try at NDS had two major flaws: It didn't allow rebuilding of the name-service directory once it was created and it lacked the ability to emulate NetWare

3.x's bindery, that version's user database.

The former problem meant that network managers had to reinstall NetWare when they needed to reconfigure NDS — for example, after a company reorganization. In an era of continual change, this alone turned many organizations against NetWare 4.01.

Novell fixed the problem by separating NDS from NetWare 4.1's core. Now network managers can rearrange NDS at will — for instance, merging two NDS directories or renaming them.

Without the ability to emulate NetWare 3.x's bindery, NetWare 4.01 required managing NetWare 4.x and 3.x servers separately, essentially eliminating the benefits of a global database. Novell corrected this by adding a NetSync bindery-emulation utility to 4.1. NetSync synchronizes as many as 12 bindery-based servers to a single NetWare 4.1 directory, giving network managers a single point of administration for both types of NetWare servers.

MAKING NETWARE MORE AFFORDABLE

Although specific details weren't available at this writing, Novell was expected to price NetWare 4.1 at 25 percent less than 4.02, making it the same as NetWare 3.1. That means a 100-user license — Novell now says it's selling licenses per connection, not user — would cost \$6,995.

In addition, NetWare for Mac, Novell's Message Handling Service (MHS), TCP/IP and System Fault Tolerance (SFT) III, separately priced products with 3.11, are now integrated into NetWare 4.1. With NetWare for Mac,

Editor's Note:

HP Professional welcomes Jim Carr as its new Networking PCs columnist. Carr is a Saratoga, California-based freelance writer who has worked in and covered the networking industry for nearly a decade. He's formerly an executive editor at LAN Magazine and a senior editor at Data Communications Magazine.

the integration not only saves companies the \$995 per five-user license, it makes Macs full NetWare clients, with the Mac version of Novell's Internetwork Packet Exchange (IPX) and Mac NDS services integrated into 4.1.

The other enhancements in NetWare 4.1 make it more cost-effective and boost performance in large networks. NLSP, for example, cuts internetwork traffic dramatically, says beta tester David Blake, an engineer at HP's printer division (Boise, Idaho).

NLSP replaces the Routing Information (RIP) and Service Advertising protocols (SAP) which generate considerable internetwork traffic and lead to unnecessarily high communications costs. By reducing broadcast traffic, says Blake, NLSP delivers greater throughput on existing communications circuits.

IT'S SUPERNOS

All in all, Novell has positioned NetWare 4.1 as a worthy enterprise-network oppo-

nent for Microsoft Corp.'s (Redmond, Wash.) Windows NT 3.5 server and Banyan Systems' (Westborough, Mass.) VINES. And there's no understating the critical importance of 4.1. It's vital to Novell's future in the NOS marketplace, for two reasons.

First, market research indicates Windows NT and VINES have cut significantly into Novell's market dominance since the release of NetWare 4.0 two years ago. Novell needs to regain marketplace momentum, and its customers' confidence, with a strong product.

Second, NetWare 4.1 is the first step in what Novell calls its "SuperNOS." Novell positions SuperNOS, an eventual melding of NetWare and Novell's UNIX, as the all-in-one enterprise network solution.

SuperNOS will become what Novell CEO Bob Frankenberg calls a "single image" of NetWare and Novell's UNIX. This merged environment would allow organizations to run all of their applica-

tions — DOS, Windows and UNIX — on a single hardware platform, an especially appealing feature.

This pits it directly against the Windows NT 3.5 server and BackOffice, the integrated "information system" package that teams NT, Microsoft's SQL, Mail, SNA and Systems Management servers. With BackOffice, Microsoft also hopes to offer customers an all-inclusive solution.

Whether Novell, or Banyan for that matter, can outlast giant Microsoft in the server marketplace remains unclear. Only time, and customer acceptance, will answer that question.

But Microsoft isn't assured of instant success in the networking market by any means. Those who remember the Microsoft-3Com LAN Manager fiasco can attest that Microsoft is more than willing to drop products it perceives as dead.

SOFTWARE

OpenV*NetBackup Ensures Data Integrity

OpenVision announced OpenV*NetBackup 1.7, which introduces comprehensive online backup capabilities to Oracle 7 databases.

The Database Extension makes it possible to back up, archive and defragment live relational Oracle databases across the network. A flexible scheduling facility fully automates the backup process. From a single management server, OpenV*NetBackup enables administrators to schedule lights out and enterprise-wide backups, while allowing end users to perform their own file backup, archive and restore operations on demand without administrator intervention through a simple point-and-click GUI.

OpenV*NetBackup enables administrators to categorize client machines with common backup and archive requirements into powerful "client classes." It requires no dedicated storage devices and it has the ability to back up to storage devices on multiple servers.

The HSM Extension enables the migration of desktop files from local disks to departmental servers while retaining immediate access to those files.

The disk-to-disk migration solution, Enterprise Extension, links departmental servers with remote servers and centralized storage management applications such as MVS DF/HSM, Cray DFS and UniTree.

The OpenV*NetBackup product family is augmented by software supporting a wide range of robotic mass storage devices, including: HP Optical Disk Libraries, HP 4mm DAT Drives, IBM 8mm Tape Carousels, Lago Systems 8mm Cartridge Tape Datawheels, Exabyte 10i/10e 8mm Cartridge Tape Stackers, Exabyte 210 8mm Cartridge Tape Stackers, Exabyte 60/120 8mm Cartridge Tape Libraries, Metrum RSS-48b and RSS-600b VHS Tape Libraries, StorageTek Automated Cartridge Systems,

ADIC 4mm DAT Autochargers and ADIC 4mm Virtual Library Systems.

Platforms supported include: SunOS 4.1.3 and Solaris 2.3, HP-UX 9.0, IBM AIX 3.2.4, IRIX 5.2 and EP/IX 2.1.

The OpenV*NetBackup server costs \$5,500, while its agents start at \$300 each. The Database Extension is \$1,000, the HSM Extension is \$20,000 with its agents priced at \$2,000 and the Enterprise Extension is \$10,000.

Does Adager charge you a fortune when you upgrade your HP3000

No!

As a matter of fact, there is *no* difference in Adager pricing between Classic (CISC, MPE V) and Spectrum (RISC, MPE XL, MPE/iX) or among different Spectrum HP3000 machines.

This is Adager's policy on MPE XL and MPE/iX, in effect since 1987:

- If you have an Adager license on a Classic machine and you just get an MPE/iX machine as an exchange, there is no Adager upgrade fee at all.
- If you have an Adager license on a Spectrum machine and you simply upgrade your CPU, there is no Adager upgrade fee at all.
- If you have an Adager license on a Classic machine and you get an additional computer that happens to be an MPE/iX machine, you simply pay the Adager fee for the additional machine.

Bonus: As part of your annual maintenance, you get an ever-increasing selection of Adager functions in native mode on RISC machines.

Bridgeway Releases EventIX Version 2.0

Bridgeway announced EventIX Version 2.0, a network management solution that bridges the gap between legacy and SNMP systems.

EventIX provides a set of tools and applications for event processing (recognition, filtering and correlation) and task automation. It includes a development toolkit, network interfaces and off-the-shelf applications that can be used "as-is" or custom fit with minimal work and expense.

Enhancements include: a Bubble interface which is an easy-to-use GUI for developing, debugging and implementing EventIX applications; SNMPv2 support; an improved NetView interface; enhanced data handling utilities; Sybase database management; and an application catalog.

PATROLINK Integrates Management Tools

BMC Software announced the availability of PATROLINK, a family of integration products for PATROL, which allows the application management functionality of

PATROL to be incorporated into many network management systems.

The family includes PATROLINK for HP OpenView, IBM NetView for AIX, Sun NetManager and POLYCENTER Manager on NetView.

PATROLINK enables system administrators to remain aware of the overall status of all applications, even when focused on the network, by incorporating PATROL's database and systems monitoring and application management capabilities into a network console.

When PATROL detects a problem, a SNMP trap is sent, regardless of whether PATROL is displayed, causing the representative icon on the network management console to flash. From there, PATROL can either notify the administrator of the problem or automatically execute the recovery action required to resolve the problem.

Price per copy is \$2,000.

Contact BMC Software Inc., 2101 CityWest Blvd., Houston, TX 77042; (713) 918-8800.

STR Offers FAX/3000 And Faxcom Enterprise

STR announced FAX/3000, a completely automated unattended system providing fax communication directly from an HP 3000. FAX/3000 includes software that resides on the HP 3000 and a fax server that connects through an HP 3000 serial port.

FAX/3000 can take data from: an MPE spooler; a programmatic interfacier; an interactive dialogue; E-mail (HPDesk, PostHaste); or PCs connected to the HP (WordPerfect, Lotus). FAX/3000 can fax the data and include PCL output, or it can integrate with graphics.

STR also announced Faxcom Enterprise, a strategy that provides companies with a comprehensive solution for managing all inbound and outbound fax traffic. Faxcom Enterprise combines the power of FAX/3000 with complete faxing capability on a LAN and other host computers. Faxcom Enterprises can handle up to 16 inbound or outbound simultaneous transmissions. Options are available enabling the Faxcom Enterprise to route incoming faxes directly to LAN users and to emulate PostScript and PCL formats. Or, use graphics integration to overlay business forms, logos or signatures into documents.

Adager Console Manages HP Databases

Adager Corp. released the Adager Console, a client-server cooperative system which monitors and manages IMAGE/SQL and TurboIMAGE databases, as well as their disk resources, on any HP 3000 system.

This Windows PC client links to Adager — a database adapter/manager for IMAGE, TurboIMAGE and IMAGE/SQL databases — on the HP 3000 server. Adager's Console keeps tight control of all databases' dataset capacities, to prevent running out of free entries during a work day.

It also determines the rate at which free disk space is disappearing. If the trend looks worrisome, database administrators get warning messages on the HP 3000 system console.

Adager's Console allows you to set up rules and exceptions, so administrators can schedule Adager maintenance tasks while preventing conflicts with production. Once the rules are defined, Adager's Console quietly monitors databases, scheduling the appropriate background Adager tasks to keep IMAGE/SQL databases in tune.

Contact Adager, The Adager Way, Sun Valley, ID 83353; (208) 726-9100.

CSI Provides ISAMATION For RM/COBOL-85 Files

CSI released ISAMATION for RM/COBOL-85 indexed files. ISAMATION quickly rebuilds indexed files in place. No additional disk space is required. ISAMATION is used to rebuild corrupted indexes files and for normal compression of indexed files to improve system performance.

ISAMATION is currently available on machines running HP-UX, AIX, SCO UNIX and TI1500 operating systems. Price is under \$1,000.

HARDWARE

Plaintree Systems Debuts 8-Port Ethernet Switch

Plaintree Systems introduced the WaveSwitch 80, a standalone eight-port Ethernet Switch that integrates with 10 Mbps Ethernet ports with 100 Mbps FDDI or 100 Mbps Fast Ethernet. The WaveSwitch 80 brings Ethernet switching technology to users of smaller workgroups.

WaveSwitch provides each desktop or small workgroup with a dedicated 10 Mbps Ethernet. It requires no reconfiguration and installation is generally accomplished in less than one hour.

WaveSwitch 80 is fully compliant with the IEEE 802.1d transparent bridging standard and the SNMP MIB II and the RFC 1493 Bridge MIB. Front panel LEDs monitor and display status and operation of each port.

The eight-port WaveSwitch costs \$6,495. With Fast Ethernet, it costs \$7,995. With Single attached FDDI, it costs \$8,995. And with dual-attached FDDI, it costs \$9,995. Contact Plaintree Systems, Seventy Walnut St., Wellesley, MA 02181; (617) 239-8077.

SoftLinx Offers Replix FaxCenter

SoftLinx announced Replix FaxCenter, a complete line of enhanced fax solutions based on a plug-and-play turnkey hardware platform.

The Replix FaxCenter series features a highly scalable platform based on Intel architecture running industry standard UNIX SVR4.2. The systems incorporate multi-channel DSP-based fax/voice boards from Brooktrout Technologies Inc., permitting high density configurations for analog loop-start or digital lines.

It includes network fax, fax-on-demand, fax broadcasting, fax/voice mailboxes, fax store-and-forward and never-busy fax.

Replix FaxCenter 1000 supports four to 16 analog lines or eight to 24 digital lines with prices ranging from \$12,000 to \$16,000, depending on software configuration. Replix FaxCenter 5000 support 16 lines and up.

Contact SoftLinx, 234 Littleton Rd., Westford, MA 01886; (508) 392-0001.

**"I DON'T GIVE
A DAMN WHERE
THE DATA IS.
I WANT THAT
REPORT ON MY
DESK, NOW!"**

When the boss needs a report, the last thing he wants to hear is a speech on incompatible platforms, tools and databases. That's why thousands of the world's leading corporations have standardized on FOCUS for accurate, consistent reports from any database on any operating system.

PORTABLE, SCALABLE AND CONSISTENT

FOCUS reports and applications are portable and scalable to more than 35 operating systems...from PC to midrange to mainframe. You can design an application in FOCUS Reporter for Windows and run it in FOCUS Reporter for Motif, Open VMS, MPE, MVS...you name it. This means your VP of Finance can get the exact same report from his mainframe as the VP of Marketing gets from his PC LAN or UNIX system. And FOCUS provides a complete development toolset. So it's easy to create a simple query or a comprehensive GUI reporting application.

ANY DATABASE, ANY PLATFORM, ANY PROTOCOL

FOCUS Reporter offers direct interfaces to all popular server databases. And with our advanced middleware technology, you can access and join files located in virtually any database (relational or legacy), using your choice of communications protocols. No other reporting tool offers an easier migration path through any change in your information architecture.

MORE POWERFUL THAN SQL TOOLS

When SQL report writers and relational tools run out of steam, FOCUS Reporter makes it simple to create even the most challenging reports with multiple subtotals in year-to-year comparisons, rankings, "what if" scenarios, one-pass "if then" calculations, conditional fields, and more. And unlike other reporting tools, the English-like FOCUS language gives you an easy audit trail to any summary number, so there's never a question about how it was calculated.

Reader Information

This month's issue contains many advertisements for hardware and software products available for your HP systems. Your investment in these products today could mean a more lucrative future for your company. Use the information below to learn more about the advertisers' offerings, then use the reader information card to initiate your direct link to valuable information about these advertisers' products.

COMPUTER MARKETING INTERNATIONAL INC. CIRCLE 454

Independent distributor of new and refurbished HP Apollo workstations and peripherals. We provide in-house technical support and depot repair services. We are committed to providing 100% customer satisfaction on every order.
Call 800-497-4CMI.

CONCORDE TECHNOLOGIES CIRCLE 232

Concorde Technologies Inc., "The Hewlett Packard Experts," offer a wide array of computer products and services specifically designed to satisfy the needs of the HP Apollo computer users. Concorde's line of products includes a full line of workstations, memory products, compatible peripherals, mass storage subsystems, application software and related accessories. Your single source for all your HP computers and enhancements, Concorde Technologies offer the best prices, availability, warranty and support.
Call Concorde Technologies at 1-800-359-0282 for complete information and pricing.

IEM CO. CIRCLE 122

IEM offers affordable solutions for the HP environment, including 4mm and 8mm tape drives, autofeeders and carousels, QIC tape drives, optical drives (WORM, MOD, Multifunction and CD-ROM), fixed Winchester drives, floppy disk drives and combination drives. Most IEM products are available with an HP-IB or SCSI interface for HP 1000, 3000 and 9000 computers. IEM offers software solutions, including automated backup and archiving.
Call (303) 221-3005 or (800) 321-4671.

INFORMATION BUILDERS INC. CIRCLE 247

4GL/DBMS for HP MPE/XL and HP-UX systems offering application development, reporting and decision support. Supported on all major platforms.
Call (212) 736-4433.

KINGSTON TECHNOLOGY CORP. CIRCLE 281

Kingston Technology designs and manufactures memory upgrades for PCs, laptops, workstations and laser printers. The Kingston product line also features mass storage subsystems and processor upgrades.
Call (800) 835-2545,
FAX (714) 435-2699.

M.B. FOSTER ASSOCIATES LTD. CIRCLE 155

DataExpress, the #1 End-User Computing Environment and report writer. EDI Windows, translation software. Reflection and the Network Series.
Call (800) ANSWERS,
FAX (613) 448-2588.

MINISOFT INC. CIRCLE 472

Minisoft 92 for DOS and Windows providing HP terminal emulation and LAN connectivity for just \$129.
Call (800) 682-0200.

NEWPORT DIGITAL CORP. CIRCLE 246

Accelerator cards for HP 9000 Series 200 plus HP 310 and HP 320. Ten-fold performance improvement.
Call (714) 730-3644.

O'PIN SYSTEMS CIRCLE 258

REVEAL from O'PIN Systems solves report distribution problems. Users go "paperless" and view reports directly from PCs or terminals. Saves time and fast payback too! Call (800) 888-1804.

TEXAS ISA INC. CIRCLE 245

Complete range of mass storage devices and their peripherals for HP 3000, 1000 and 9000 from ISA.
Call (713) 493-9925,
FAX (713) 493-2724.

UNISON SOFTWARE INC. CIRCLE 499

Unison-Tymblabs is a supplier of networked systems management solutions for both UNIX and MPE. Product areas include workload management, storage management, print automation and desktop integration. Call (408) 245-3000.

VITALSOFT CIRCLE 143

Try Visimage, the original client-server report writer for HP computers. Quickly become productive in a Windows or DOS client environment. HP server processing offers immediate access to all your system data, subject only to limitations set by the system manager. Call (800) VITALSOFT for free demo.

WRQ (WALKER RICHER & QUINN) CIRCLE 263

Makers of Reflection Series Software. HP terminal emulation for PCs and Macintoshes. Call (800) 872-2829.

WESTERN SCIENTIFIC MARKETING INC. CIRCLE 480

Western Scientific offers a line of high-performance peripherals to upgrade and enhance your Sun, HP, Silicon Graphics, DEC, IBM RS/6000 and Novell workstations. We use quality components from premier suppliers such as Seagate, HP, DEC, IBM, Conner/Archive, Exabyte, Tating Overland Data/Cipher and Adic. We configure, integrate and test innovative disk, tape optical, RAID, jukebox and memory subsystems to meet your application requirements.
Call (800) 443-6699.

The logo features the letters "HP" in a large, bold, serif font. To the right of "HP", the word "Professional" is written in a smaller, elegant, serif font.

Megahertz Introduces Ethernet*Modem Card

Megahertz announced its PCMCIA Ethernet-modem combination card which combines 14.4 Kbps fax modem and 10BaseT Ethernet adapter technology.

Megahertz's Ethernet*Modem is capable of simultaneous fax/modem and Ethernet connections. It will connect mobile computing users to all popular networking systems (Novell NetWare, Banyan Vines, Windows for Workgroups, Windows NT Server, Artisoft LANtastic, Microsoft LAN Manager, IBM LAN Server and HP LAN Manager), and will include DOS ODI and DOS NDIS drivers.

Through an intuitive, menu-driven software, the product can be installed and configured within minutes. The program automatically configures the mobile computer for optimum use of the combination card. It also provides a hot insertion capability, allowing the user to insert or remove the Ethernet*Modem without rebooting the computer.

Contact Megahertz, 605 N. 5600 W., P.O.

Box 16020, Salt Lake City, UT 84116; (801) 320-7000.

API International Announces Unispool

API International announced that Unispool, a print management software system, is now available for companies deploying Microsoft Windows NT servers and clients.

In addition to Windows NT, Unispool interoperates with HP, IBM, DEC and Sun Systems, as well as Novell, SCO UNIX and other PCs, plus UNIX workstations and servers. Unispool also includes a NLM to link Novell servers. The Unispool NLM eliminates the need to set up a Novell gateway PC between NetWare print servers.

Unispool re-routes print files automatically around failed or jammed printers, following an organization's established business processes. It will bridge networks and systems to reach alternate devices and automatically archives print jobs, to ensure availability of mission-critical documents such as invoices or payables checks.

The Unispool Control Language automates print file management, and managers can use the language's profiles to solve communications problems. A Network Spooling Module transfers print files to more than 120 systems on TCP/IP or X.25 networks.

Other features include: a Spoolfile Management unit; Local Spooling; Novell and LAN Manager modules; a Distribution module; an XPORT module; and a Jobsaver Module for HP 3000s.

Contact API International, P.O. box 91027, Austin, TX 78709; (512) 280-4391.

Circle 381 on reader card

Telebyte Provides Model 277 FlexMode

Telebyte Technology Inc. announced the Model 277 FlexMode Fiber-Optic Modem, an asynchronous fiber-optic modem whose optical interface operates in point-to-point or ring (daisy-chain) configurations and whose electrical interface operates in point-to-point or multidrop configurations depending on the user selected interface.

SAFE/3000 - Security For Your HP3000 Mainframe

Developed in conjunction with an HP major account, SAFE/3000 is the only HP3000 security software to implement logon, file, database, and network access control and auditing features available with mainframe packages such as ACF2 and RACF. Security is easy to use with SAFE/3000's object orientation and fill-in-the-blank menus, SAFE/3000 reduces your workload by allowing secure distribution of security administration tasks.

SAFE/3000 closes security loopholes Logon-UDC based packages such as VESOFT and OCS/Private cannot. Monterey Software worked closely with HP to base SAFE/3000 on MPE iX AIFs. This unique integration gives you mainframe level

logon, file and database access control and auditing with low overhead and 100% MPE, application and network compatibility.

Call for a PC based diskette that demonstrates the latest in secure HP 3000 technology. Even if you already have

an add-on security product, you still need to know about these exciting new capabilities. Call 800-398-1468 now and learn how you can easily and quickly ensure the integrity of both access and data on your HP3000.

Transition Engineering Offers StackMaster Bridge Module

Transition Engineering announced that an integrated Bridge Module is available for the StackMaster, a stackable, manageable hub. The Bridge Slide-In-Module is a two-port bridge connecting a workgroup or department to a backbone network. It fits in the Slide-In-Card slot in the back of the unit. The bridge module also can be used with other Transition Engineering products including the Multi-Media Repeater and the 24-port, unmanaged 10BaseT Hub.

The bridge performs wire rate filtering and forwarding of up to 14,880 packets per second with less than 14 microsecond delay. An integrated 32 KB packet buffers messages in both directions.

The Bridge Module automatically learns up to 256 addresses on the workgroup side and supports any number of devices on the network port. It is IEEE 802.3-compatible.

The modular StackMaster system supports two repeater modules per unit. Repeater modules support either eight 10BaseT or six 10BaseFL ports.

The Bridge Modules costs \$699. The modular StackMaster costs \$995 for a 16-port 10BaseT unit and \$695 for the optional Management Unit.

Contact Transition Engineering Inc., 7090 Shady Oak Rd., Eden Prairie, MN 55344; (612) 941-7600.

Circle 379 on reader card

LANCAST Provides Translator Interface

LANCAST announced the 4368 "the twister" Translator Interface. The 4368 is a unique modular design that allows interconnection of thin, twisted-pair and fiber-optic segments within a single unit. The design allows a single chassis to house up to seven translator interface modules in any combination. Hot swappable modules provide a variety of connector combinations.

All signal activity, including collision data, is reliably translated assuring accurate communication and collision detection in any combination of connected segments or devices. The 4368 does not count as a repeater budget, which provides maximum flexibility to a new or existing network.

The 4368 is easily upgradeable by the user

because all connections are front accessible for ease of installation and maintenance.

Contact LANCAST, 10 Northern Blvd., Unit 5, Amherst, NH 03031; (603) 880-1833.

In Defense Of The Assault

From The Trenches, the AS/sault Looks Like A Winner

By Richard Essery

It was with a great deal of interest that I read the "Into The Valley" editorial in the November 1994 issue. I thought that I had inadvertently picked up my copy of *News 3X/400*, because there was a degree of negitiveness which I usually find in the "Pro IBM" magazines; but no, it was *HP Professional*.

I have worked with HP in Canada and the United States migrating IBM S/36 users, and can therefore attest that the HP AS/sault program is going to be a large thorn in the side of IBM.

With over six years in this market, I have seen thousands of unhappy S/38 and AS/400 users in North America. HP's "S/36 Strike" program that was conducted during the last two years is a common solution for many of these disgruntled 36ers. And, when a senior IBM Manager wishes to partner with me because "HP has been eating our lunch" in this market, you know it has affected IBM.

In response to the comments from the Aberdeen Group that the AS/400 has challenged HP, I believe that the AS/400 has not challenged HP. Rather, the AS/400 has challenged IBM's own RS/6000.

And the great myth that re-engineering an application is the equivalent of building the great pyramids of Giza is fading fast. Today, proprietary application re-engineering is facilitated through several automated tools. For example, a user can implement either an emulation tool or a true conversion tool and realize numerous benefits from both products. The end-user does not have to be retrained because the software still looks and feels the same, and the company also retains the past investment in their software.

Specifically, for those users who don't want to abandon the S/36, there is California Software's Baby 36 which allows programmers to use their PCs at the office, at home or at a client site to do development work, as well as allowing the company or other departments to use the present software on a PC-based system.

Users have the choice of a number of operating systems — DOS, Novell, OS/2 or NT. If the user

needs more storage or power, they have Baby 36 or Open RS/36 from Universal Software. Open RS/36 lets users port their environment to a UNIX platform like the HP 9000 with a direct link to an RDBMS like Oracle or Informix. For those S/36 users who want to migrate to "open systems" and have the need to bring the current software to a UNIX system, there is Liberate/36. This tool will convert and migrate all RPG, COBOL and OCL to flat files or a 4GL/RDBMS of your choice.

For the S/38 or AS/400 user, the choice is the same — emulation or conversion. California Software released their Baby/4XX Development tool in October 1992 and followed with the Runtime license in June 1993 for DOS, Novell, OS/2 and finally NT. Last month, they released version 1.6. With their new release comes Baby 4 UNIX, which supports all UNIX platforms including HP-UX and AIX.

To complete "the circle of change" for migration, there is "Making Progress" from EFA Software Services. EFA Software Services is a department within EFA that was started when the company needed to bring their Oil and Gas Exploration software from the AS/400 to an open systems environment. After re-engineering their software, they were approached by Alders UK, an organization that specializes in Duty Free shops at airports worldwide.

Initially, EFA converted all RPG, COBOL and CL into the Progress 4GL/RDBMS. And after being urged by people like myself, they now have numerous sites using the Oracle 4GL/RDBMS.

So, regardless of the reason — abandoning the 3X/400 platform, the need for additional storage or power, departmental systems or telecomputing — there is a market and there is a need for change. Open systems are here to stay. And HP will continue to be the open systems provider of the future.—*Richard M. Essery is the principal consultant at R.Y.E. Enterprises in Mississauga, Ontario, and an HP Professional reader.*

"top scores in six areas"

Computerworld Buyers' Satisfaction Scorecard

Of our 1900 clients worldwide, an impressive number are now up and running with Lawson client/server open enterprise solutions. On SYBASE®, ORACLE® and INFORMIX®

According to *Computerworld's* Guide to Client/Server Financial Software, an even more impressive number give us top scores in all six categories: Responsiveness of Service, Ease of Use, Overall Reliability, Reporting Capabilities, Interfacing with Other Applications and Quality of Support. In fact, Lawson was highest in overall satisfaction of all the companies surveyed.

Call us at 1-800-477-1357 extension 838, and find out why.

PC connectivity?

Reflection makes it child's play.

If connecting PCs to minicomputers, mainframes, and servers has you puzzled, choose Reflection® and Reflection Network Series® software from WRQ.

No other software vendor offers such a complete solution to integrate personal computers with HP 3000, HP 9000, VAX/VMS, UNIX, and IBM systems. Reflection provides the most precise terminal emulation for text and graphics, fast file transfer, a versatile command language, and more—for DOS, Windows, and Macintosh platforms. Reflection also offers a reliable PC X server. All

backed by a solid company with exceptional technical support.

If you want to run host and server applications at the same time, add the Reflection Network Series. Run NS/VT, LAT, Telnet, and TCP/IP concurrently with LAN protocols from a single PC, over Ethernet or Token-Ring networks. The Reflection Network Series also includes support for Berkeley Sockets, NetBIOS, and NetIPC—yet it takes remarkably little memory.

Putting all the pieces together can be challenging. So avoid the mind games. True genius is simplicity.

Whether you need basic PC-to-host connections, links to multiple hosts and LANs, or you're moving to the world of X, there's one obvious solution: Reflection.
